ABSTRACT OF THE DISCLOSURE

ENABLING A SENDER TO CONTROL FUTURE RECIPIENTS OF AN EMAIL

A method, system, and program for enabling a sender to control future recipients of an email are provided. An email is received with at least one pre-selected future recipient at a computer system accessible to a primary recipient of the email. The pre-selected future recipient is distinguishable from a sender of an email. The received email is displayed. Then, responsive to the primary recipient electing to respond to the email, a response email is automatically addressed to the at least one pre-selected future recipient, such that a sender of the email controls future recipients of the email by pre-selecting the at least one future recipient. Future recipients may be selected by the sender for each email or automatically selected from a database of addresses each with a pre-selected future recipient based on the primary recipient of the email.
